# ServiceNow Application Developer

Securing Applications Against Access from Other Applications > Application Settings

Application settings determine whether an application can access resources from another application. Application designers can configure:

- Availability of cross-scope tables in Studio

- Ability for cross-scope scripts to run on application resources

To edit the application settings, open the application for editing in Studio. Open the **File** menu and select the **Settings** menu item.

Custom Application
NeedIt

✱ Name	NeedIt
Scope	x_58872_needit
Application administration	☐
JavaScript Mode	ES5 Standards Mode

Version	1.0.0
